

High-performance FSK Wireless Transceiver Module

# SPECIFICATION

Model No.: DL-RTS4432

Version: V2.0

**Before using this module, please read this document carefully, and pay attention to the following important matters:**

This module is an electrostatic sensitive product. Please operate it on an anti-static workbench during installation and testing.

The module uses an external antenna by default. The antenna can be a wire antenna or a standard UHF antenna. You can choose a specific antenna according to the actual situation. If the terminal product uses a metal shell, be sure to install the antenna outside the metal shell. Otherwise, the RF signal will be seriously attenuated, which will affect the effective distance.

Metal objects and wires should be kept away from the antenna as much as possible.

When installing the module, nearby objects should be kept at a sufficient safety distance from the module to prevent short circuit damage.

This module should be used in a dry environment. Please do not make any liquid substance come into this module.

Please use an independent voltage regulator circuit to supply power to this module, and avoid sharing with other circuits. The tolerance of the power supply should not be less than 5%.

### **Limitations:**

This module is intended to be embedded in the customer's terminal product application, and does not provide a casing itself. It is not recommended that the customer directly resell this module as a final product without permission.

This series of modules are in accordance with commonly used international standards. If there is any special certification needed, we can adjust certain indicators according to your needs.

This module cannot be applied to life rescue, life-support systems, or any occasion where personal injury or life threatening may be caused by equipment failure. Any organization or individual carrying out the above-mentioned applications shall bear all risks at their own.

We will not be responsible for any direct or indirect damage, injury or loss of profits caused by products that use this module.

DL-RTS4432 was designed base on Silicon Labs' Si4432 wireless transceiver chip. It is a compact, low-power, long-distance wireless transceiver module. The chip launched by Silicon Labs is mainly set to 315MHz, 433MHz, 868MHz, 915MHz and other special frequency bands of the national networks. The sensitivity can reach -121dbm, the maximum transmission rate can reach 128Kbps, and the output power can range from +1dbm to + 20dbm through the register configuration.

This module integrates all RF-related functions. Users do not need to have a deep understanding of RF circuit design; they can use this module to easily develop wireless products with stable performance and high reliability, shortening the product development cycle.

The module adopts single-chip architecture, and the periphery adopts high-precision crystal, high-Q Murata inductor, small volume but high-capacity filter capacitor. All SMD components are used, and the interface is encapsulated with standard pitch stamps, which is conducive to the development of compact systems and the application of mass placement.

## 1. Features:

- 1200m transmission distance (1200bps)
- Working frequency: 433.92m (other frequencies need to be customized)
- Operating voltage: 1.8V-3.6V
- Low current loss in SHUTDOWN mode
- Efficient 4 - line SPI interface
- Separate 64-byte RX FIFO and TX FIFO
- Support WOR wireless wake-up function for portable devices

## 2. Applications:

- Wireless sensor;
- Home automation;
- Automated data collection;
- Industrial remote control, telemetry;
- Data monitoring and transmission;
- Home Appliance Control;
- Security, alarm control;

### 3. Pins Definition:

Pin	Name	Description	Remark
1	ANT	Antenna interface, 50Ω standard impedance	50Ω
2	GND	Grounding, common ground with the system	
3/4	NC	Free pins, not connected to any hardware	
5	VCC	Power supply, DC2.0~3.6V	
6	GPIO_0	Implement different functional applications, and configure AMP transceiver capabilities	Configure Registers
7/8	NC	Free pins, not connected to any hardware	
9	GND	Grounding, common ground with the system	
10	SDO	SPI data output, MISO	
11	SDI	SPI data input, MOSI	
12	SCLK	SCLK input	
13	NSEL	SPI chip select input terminal	
14	NIRQ	For MCU Data Transmit/Receive Interrupt Response Processing	I/O
15	SDN	SDN=0 means working, SDN=1 entering low power state	Register value missing
16	GND	Grounding, common ground with the system	

Table 1: Pins Definition of DL-RTS4432 Module

#### 4. Product size

Figure 1: Module size

#### 5. Technical Parameter

##### DC characteristics

Description	Min.	Max.	Unit
Supply voltage	1.8	3.6	V
Working current	RX <20mA	TX=85mA@20dbm	mA
Standby current		<1uA	mA
IO port voltage	Vss-0.3	Vdd+0.3	V
Working temperature	-40	85	℃

Table 2: DC characteristics of the Module

##### RF characteristics (Unless otherwise stated, the temperature is 25 ℃, and VCC is 3.3V)

No	Characteristics	Index parameter range			Unit
		Min.	Typi.	Max.	
1	Frequency range	240	433.92	930	MHz
2	Frequency interval		100K		Hz
3	Transmit power	+1		20	dBm
4	Receive sensitivity		-121		Dbm
5	Modulation	GFSK	2-FSK	OOK	MSK

6	Transmission rate	1.2		128	Kbps
7	Harmonic power	-45	---	-35	dBm
8	Communication distance	800		1200	M
9	OOK Modulation mode, sensitivity		-110		dBm
10	OOK modulation mode, rate			40	Kbps
11	Standby power consumption			0.9	MHz
12	Crystal accuracy		10		PPM

Table 3: High frequency characteristic table of the module

## 6. Connection between module and terminal equipment (TTL electrical level)

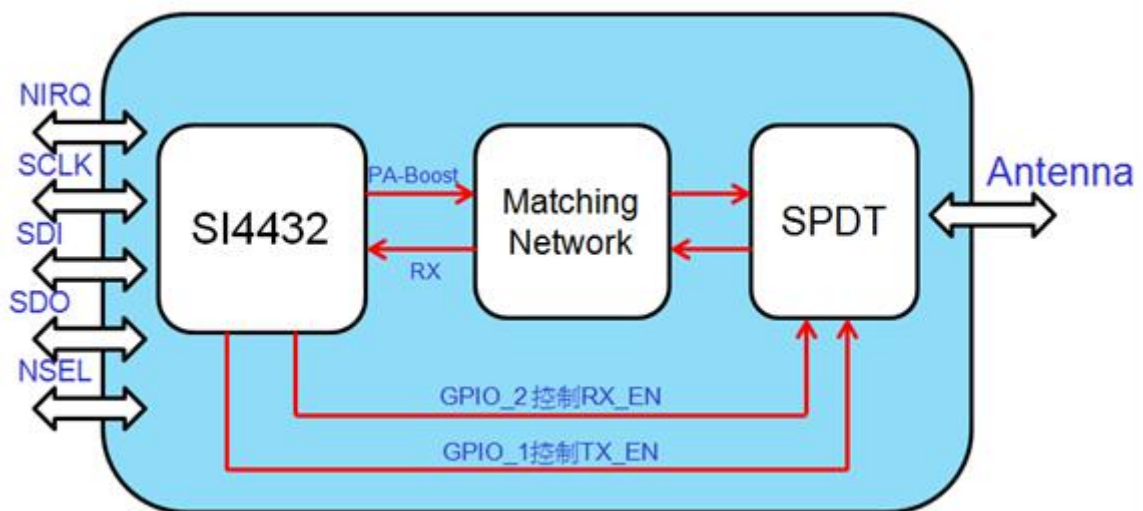

Figure 2: Wiring diagram for module application

## 7. Problems in module application

Considering the complexity of data transmission over the air, the radio frequency modulation method of the data, and some inherent characteristics of electromagnetic waves, the following issues should be considered during the application process.

1. The electromagnetic interference of the application environment will affect the actual distance of the remote control. Electromagnetic wave interference is divided into mainboard power supply interference, TFT screen data cable interference, Flash data exchange interference; and airborne carrier frequency interference, noise interference,

high-power signal source interference, etc.

2. Factors such as product size, internal space, and coating of the shell will cause the attenuation of the wireless signal, which will affect the remote-control distance. Usually the narrow internal space of the product is not conducive to the extension of the antenna. The outer shell should avoid metal or metal plating as much as possible.
3. To choose a proper antenna is very important. The antenna is an important part of the communication system, and its performance directly affects the indicators of the communication system. We must pay attention to its performance (antenna type, antenna electrical performance) when selecting the antenna. Please feel free to contact us for consultation or recommendation, if you need.
