TP4055X  
(500mA Linear  
Li-Ion Battery Charger)

## DESCRIPTION

The TP4055X is a complete single cell lithium battery charger with battery positive and negative pole reverse protection and input power positive and negative pole reverse protection on a single chip, with a charging current of 500mA, and it includes trickle, constant-current and constant-voltage. Its SOT23-5 package and low external component count make the TP4055X ideally suited for portable applications. Furthermore, the TP4055X can work within USB and wall adapter.

Thermal feedback regulates the charge current to limit the die temperature during high power operation or high ambient temperature. Full charge voltage of 4.2V, and the charge current can be programmed externally with a single resistor. The TP4055X automatically terminates the charge cycle when the charge current drops to 1/10th the programmed value after the final float voltage reaching.

When the input supply (wall adapter or USB supply) is removed, the TP4055X automatically enters a low current state, dropping the battery drain current to less than 1uA. Other features include under voltage lockout, automatic recharge and one status pins to indicate charge termination.

## FEATURES

- 500mA Programmable Charge Current
- VCC input reverse connect protection
- Lithium-ion batteries Reverse battery protection
- Maximize Charge Rate Without Risk of Overheating
- For Single Cell titan acid Lithium-Ion Batteries
- Trickle, constant-current and constant-voltage control
- Charges Single Cell Li-Ion Batteries Directly from USB Port
- Preset Charge Voltage with 1% Accuracy
- Highest input can be up to 9V
- Automatic Recharge
- One Charge Status Output Pins
- C/10 Charge Termination
- 60uA Supply Current in Shutdown
- Available in 5-Lead SOT-23 Package

## APPLICATIONS

- Micro lithium battery, charging dock, mobile power supply
- handheld mobile devices、 Intelligent Wearing、 Bluetooth applications

## TYPICAL APPLICATION

Figure 1 500mA Single Cell Li-Ion Charger

Note: Proposed R1 dissipation resistor, it can get a larger charge current, and also improve the reliability of the machine. Resistance is selected according to the actual situation (0 ~ 0.6  $\Omega$ ).

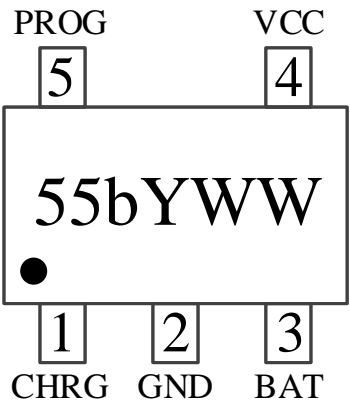

### Complete Charge Cycle (500mAh Battery)

### ABSOLUTE MAXIMUM RATINGS

- VCC: -6.5V~9V
- PROG: -0.3V~VCC+0.3V
- BAT: -4.2V~7V
- CHRG: -0.3V~9V
- BAT Pin Current: 700mA
- PROG Pin Current: 2mA
- Maximum Junction Temperature: 150°C
- Operating Ambient Temperature Range: -40°C~85°C
- Storage Temperature Range: -65°C~125°C
- Lead Temperature(Soldering, 10sec): 260°C

## PACKAGE DESCRIPTION

	TP4055X-42-SOT235
	PART MARKING
	55bYWW→4.2V

### Pin Description

**CHRG (Pin1): Open Drain Charge Status Output** When the battery is being charged, the CHRG pin is pulled low by the internal switch to indicate that charging is in progress; otherwise, the CHRG pin is in a high-impedance state.

**GND (Pin2): Ground Terminal**

**BAT (Pin3): Battery Connection Pin**

This pin provides the charging current to the battery and adjusts the final float voltage to 4.2V. An accurate internal resistor divider for this pin sets the float voltage, which in the shutdown mode, the internal resistor divider is disconnected.

**Vcc (Pin4): Positive Input Supply Voltage**

This pin supplies power to the internal circuit. Vcc varies from 4V to 8V and should be bypassed by at least one 10μF capacitor. When Vcc drops to within 100mV of the BAT pin voltage,

TP4055X enters low power sleep mode, dropping BAT pin's current to less than 1uA.

**PROG (Pin5): Charge current setting, charge current monitoring and shutdown pin**

A precision of 1% of the resistance  $R_{PROG}$  between the pin and ground to set the charge current. When in constant charge current mode, the voltage of the pin is maintained at 1V. The PROG pin can also be used to turn off the charger. Setting the resistor to ground, a 0.2uA current internally pulls the PROG pin high. When the pin voltage reaches the shutdown threshold voltage 2.7V, the charger enters shutdown mode, charging is stopped and the input supply current to 60μA. Re-connecting  $R_{PROG}$  to ground will cause the charger to return to normal operation.

## ELECTRICAL CHARACTERISTICS

The ● denotes specifications which apply over the full operating temperature range, otherwise specifications are at TA=25°C, VCC=5V, unless otherwise noted.

SYMBOL	PARAMETER	CONDITIONS		MIN	TYP	MAX	UNITS
VCC	Input Supply Voltage		●	4.5	5	9	V
ICC	Input Supply Current	Charge Mode, R <sub>PROG</sub> = 10K	●		60	130	μA
		Standby Mode (Charge Terminated)	●		60	130	μA
		Shutdown Mode (R <sub>PROG</sub> Not Connected, VCC < VBAT, or VCC < VUV)	●		60	130	μA
V <sub>FLOAL</sub>	Regulated Output (Float) Voltage	0 °C ≤ TA ≤ 85 °C, I <sub>BAT</sub> =25mA, R <sub>PROG</sub> =10K		4.158	4.2	4.242	V
I <sub>BAT</sub>	BAT Pin Current (Except that VBAT=4.0V)	R <sub>PROG</sub> = 10K, Current Mode	●	100	120	140	mA
		R <sub>PROG</sub> = 2.2K, Current Mode	●	425	500	575	mA
		Standby Mode, VBAT = 4.3V			-1.5	-6	μA
		Shutdown Mode (R <sub>PROG</sub> Not Connected)			±1	±2	μA
		Sleep Mode, VCC = 0V			0	-1	μA
I <sub>TRIKL</sub>	25% Trickle Charge Current	V <sub>BAT</sub> < V <sub>TRIKL</sub> - 0.4V, R <sub>PROG</sub> = 10K	●	20	30	40	mA
VUV	VCC Undervoltage Lockout Threshold	From VCC Low to High	●	3.6	3.8	4	V
I <sub>TERM</sub>	C/10 Termination Current Threshold	R <sub>PROG</sub> = 10K	●	10	12	14	mA
		R <sub>PROG</sub> = 2.2K	●	40	50	60	mA
V <sub>PROG</sub>	PROG Pin Voltage	R <sub>PROG</sub> = 10K, Current Mode	●	0.9	1	1.1	V
I <sub>VIN</sub>	VIN reverse leakage current	VIN reverse, VBAT = 4.2V		0		20	μA
I <sub>BAT</sub>	Battery reverse leakage current	Battery reverse, VIN = 5V		0	9	10	mA

## OPERATION

TP4055X is a single lithiumion battery charger using constant current/constant voltage algorithm. It is capable of providing 500mA charging current (with the help of a thermally designed PCB layout) and an internal P-channel power MOSFET and thermal regulation circuit. No isolation diodes or external current detection resistors; Thus, the basic charger circuit requires only two external components. Not only that, the TP4055X can also get a working power supply from a USB power supply.

### Normal charging cycle

A charging cycle begins when the Vcc pin voltage rises above the UVLO threshold level and a 1% precision setting resistor is connected between the PROG pin and ground or when a battery is connected to the charger output. If the BAT pin level is lower than the trickle charging threshold voltage, then the charger enters the trickle charging mode. In this mode, the TP4055X provides about 25% of the set charging current in order to raise the current voltage to a safe level for full current charging.

When the BAT pin voltage rises above the trickle charging threshold voltage, the charger enters the constant current mode, which provides a constant charging current to the battery. When the BAT pin voltage reaches the final floating charging voltage, TP4055X enters the constant voltage mode and the charging current begins to decrease. When the charging current drops to 1/10 of the set value, the charging cycle ends.

### Charging current setting

The charging current is set by a resistor connected between the PROG pin and the ground. The setting resistor and charging current are calculated by the following

formula, and the resistance value of the resistor is determined according to the required charging current:

$$\text{Formula one : } R_{PROG} = \frac{1100}{I_{BAT}} \quad (I_{BAT} > 0.2A)$$

$$\text{Formula two: } R_{PROG} = \frac{1200}{I_{BAT}} \quad (I_{BAT} \leq 0.2A)$$

In applications larger than 0.4A, the chip heat is relatively large, and the temperature protection will reduce the charging current, and the test current in different environments is not completely consistent with the theoretical value calculated by the formula. In customer applications, an R<sub>PROG</sub> of an appropriate size can be selected as required ( **for reference only, It is not recommended to use currents below 50mA** ) .

R <sub>PROG</sub> (K)	I <sub>BAT</sub> (mA)
24	50
10	120
6	200
3.6	300
2.8	400
2.2	500

### Charge termination

The charging cycle is terminated when the charging current drops to 1/10 of the set value after reaching the final floating charging voltage. This condition is detected by using an internal filter comparator to monitor the PROG pins. Charging is terminated when the PROG pin voltage drops below 100mV for more than t<sub>TERM</sub>. The charging current is locked off, and the TP4055X enters the standby mode. At this time, the input power current drops to 60μA. (Note: C/10 terminates in trickle charging and heat limiting modes).

When charging, the transient load on the BAT pin will cause the PROG pin voltage to drop below 100mV temporarily between 1/10 of the DC charging current to the set value. The filter

time ( $t_{TERM}$ ) on the termination comparator ensures that transient loads of this nature do not cause premature termination of the charging cycle. Once the average charging current drops below 1/10 of the set value, the TP4055X terminates the charging cycle and stops providing any current through the BAT pin. In this state, all loads on the BAT pins must be powered by batteries.

In standby mode, TP4055X continuously monitors the BAT pin voltage. If the pin voltage drops below the recharging voltage threshold ( $V_{RECHRG}$ ), another charging cycle starts and supplies current to the battery again. When manual restart of the charging cycle is performed in standby mode, either the charger must be cancelled and then the input voltage applied, or the charger must be turned off and restarted using the PROG pin.

## Battery reverse connection

### protection function

TP4055X has a lithium battery reverse connection protection function. When the positive and negative poles of the battery are reversed and connected to the current output BAT pin of TP4055X, TP4055X will stop and display a fault status without charging current. The charging indicator pin is in a high resistance state, and the LED is slightly lit. At this time, the reverse connected battery leakage current is less than 10mA. Connect the reversed battery correctly, and TP4055X will automatically start the charging cycle. After the reverse connection of TP4055X, when the battery is removed, the TP4055X indicator light will not immediately light up normally because the output terminal BAT pin capacitance potential of TP4055X is still negative. Only by correctly connecting the battery can charging be automatically activated. Or wait for a long time for the negative potential of the BAT terminal

capacitor to discharge light. If the BAT terminal potential is greater than zero volts, TP4055X will display a normal no battery indicator light status.

In reverse connection, the power supply voltage should be around the standard voltage of 5V and should not exceed 5.5V. When the power supply voltage is too high and the battery voltage is reversed, the voltage difference of the chip will exceed the maximum withstand voltage.

## VIN input reverse connection protection function

TP4055X also has a power reverse protection function. When the positive and negative terminals of the VIN are reversed at the TP4055X VCC pin, TP4055X will stop and display a fault status with no charging current. The charging indicator pin is in a high resistance state, and the LED light is off. At this time, the leakage current of the reverse connected power supply is less than 10  $\mu$  A. Connect the reversed power supply correctly, and TP4055X will automatically start the charging cycle.

## Charging status indicator

### (CHRG)

The TP4055X has one drain open state indicating output, CHRG. When the charger is in charge state, CHRG is pulled to low level, and in other states, CHRG is in high resistance state. When the battery is not connected to the charger, CHRG outputs a pulse signal indicating that the battery is not installed. When the external capacitor connected to the battery end is 1uF, the CHRG flashing period is about 0.1-0.8 seconds; when the external capacitor of the BAT pin connected to the battery end is 10uF, the CHRG flashing period is about 0.5-3 seconds.

point, which roughly corresponds to 80 to 90 percent of the battery capacity. This ensures that the battery is maintained at (or near) a full charge and obviates the need to start a periodic charging cycle. During the recharging cycle, the CHRG pin output re-enters a strong pull-down state.

Figure 3

Once the charging cycle is terminated, the TP4055X immediately employs a comparator with a filter time ( $t_{\text{RECHARGE}}$ ) to continuously monitor the voltage on the BAT pin. The charging cycle restarts when the battery voltage drops below the recharging voltage

## Packaging description
