

AM3352-SOM, board revision C - GPIO pinout

Double check the orientation of the connectors and the starting pin. Pin numbers 1 & 2 are printed near the plastic connector.

DOUBLE CHECK WHICH OF THE POWER PINS ARE INPUTS BEFORE PROVIDING POWER. THE SCHEMATIC OF AM3352-SOM IS AVAILABLE AND SHOULD BE USED TO VERIFY ANY SUSPICIOUS INFORMATION.

"AM3352 PIN" field has the pin names as per AM335x datasheet. For full details about a specific pin (multiplexing, usage, registers, etc) please refer to the mentioned AM335x datasheet - the ball package is ZCZ. It is highly recommended to refer to source documentation released by Texas Instruments. If you are implementing additional interfaces you would also need to recompile the kernel of the default image. Instructions might be found at the wiki. The pin definitions are found in the dts file - you would need to edit it. The default file we use is am335x-olimex-som.dts and it is located in arch/arm/boot/dts/.

The processor AM3352 has a lot of multiplexing pins! Make sure to use the "Pin Mux Utility" tool provided by Texas Instruments to determine what are the pins of each interface and which ball goes.

Signals with (NC) in the name are routed to the corresponding processor pin but are disconnected by default.

"AM3352 BALL" marked with "-" indicate that the signal is related to the power supply circuit. Such signals are not directly connected to the microcontroller and you should be careful when operating those signals. Improper use might lead to short-circuits.

The field "MULTIPLEXING" refers only to the design of AM3352-SOM; there might be multiplexing on the corresponding pin in design of the board of peripherals (AM3352-SOM-EVB).

*PINS 33 AND 34 DO NOT REACH THE PROCESSOR DUE TO THE MISSING RESISTORS R29 AND R32. THE VALUES OF THESE PINS CAN BE USED TO CHANGE THE SCANNING MODE (ORIENTATION) OF THE OLIMEX DISPLAYS DYNAMICALLY. THE DEFAULT SCANNING MODE IS "UP TO DOWN, RIGHT TOLEFT". REFER TO THE DISPLAY DATASHEET FOR POSSIBLE VALUES. REFER TO THE DISPLAY SCHEMATIC TO FURTHER TRACE THE LCD SIGNALS (THEY CAN BE FOUND ON GPIO1 PINS 2-15 AND 2-24).

**PIN 36 PROVIDES OPTION ON WHICH SIGNAL WOULD DRIVE THE BACKLIGHT. BY DEFAULT PWM0 OUT IS CHOSEN. THE OTHER TWO OPTIONS PROVIDED ARE P1_18/EHRPWM1A/TXD3 AND P3_15/SPI1_D0(MISO). YOU WOULD NEED TO REMOVE R38 AND PLACE IT ON THE PADS OF EITHER R36 OR R37. PLACING R36 WOULD ENABLE P1_18/EHRPWM1A/TXD3. PLACING R37 WOULD ENABLE P3_15/SPI1_D0(MISO). WARNING! RE-CONFIGURATION MIGHT BRICK YOUR DEVICE! IT IS NEITHER NEEDED FOR TYPICAL OPERATION NOR RECOMMENDED.

**LCD DATA PINS #0 TO #15 ARE USED DURING INITIAL BOOT TO SET THE SYSTEM BOOT CONFIGURATION. THE DEFAULT BOOT PRIORITY SET BY LCD DATA PINS IS USB0->NAND->SPI0->MMC0. REFER TO THE AM3352 DOCUMENTATION FOR MORE INFORMATION ABOUT THE SYSTEM BOOT CONFIGURATION.

ONLY NOTABLE FUNCTIONS ARE MENTIONED. FOR FULL LIST OF FUNCTIONS AND PIN MULTIPLEXING - REFER TO THE PROCESSOR'S DATASHEET.

AM_CON-GPIO3

AM_CON-GPIO2

The step between the pinholes of each of the GPIO connectors (including the LCD connector) is 0.05''

The step between the pins of the UART0 debug header is 0.1''

You need a cable with a level shifter to establish a proper serial connection with the UART0 debug header
